

What? You had the chance to avoid all this and protect your employees *TWO YEARS AGO*? And how many employees got hurt? Forty-three? We're done here. Court is dismissed and will resume tomorrow at nine a.m. Mr. Business-owner, may I suggest you bring your checkbook in the morning!

YOU NEED TO CONSULT YOUR LEGAL COUNSEL NOW AFTER BEING INFORMED OF THIS THREAT.

As average, hard-working US citizens, we had no idea this was coming. The same goes for most citizens in countries of the free world. Governments and top scientists, however, the inventors of these new RF/EMF weapons (back in the 1950's!), have obviously known about it! Decades ago, they installed *their own* RF/EMF detection system in every US airport and most federal government buildings!

We live in a world of massive government oversight, uncountable laws and overregulation with attorneys who prompt huge (the most profitable and only the slam-dunk ones easiest to win) lawsuits. It seems all resemblance of morality and ethical behaviour is under attack, or has already suffered its demise.

For most of us, we didn't make it this way (we certainly didn't/don't want it this way), but instead we found it this way and it seems we are stuck with it.

The good parts about all this are:

- 1) Current scientists, engineers and concerned US citizens discovered this new high-tech terrorist threat and decided *NOT* to be sheep, lay back and wait for our families and fellow US citizens to be slaughtered - without warning, without any defense;
- 2) We had time to design and build the anti-terrorist defenses required to detect, discover and render harmless these threats when they are finally deployed;
- 3) NxDef took on the challenge of designing, manufacturing, distributing and developing a network of confidential Distributors and confidential Resellers in the US who will sell, install and service these detectors for the mutual benefit of all US citizens;
- 4) These products are now available at a reasonable cost to commercial/office/industrial property-owners so that they, and those for whom they are responsible, can be protected when the time finally comes;

The bad parts about all this are:

- 1) Now that you have been informed of this new threat... and now that you have been offered the opportunity to protect yourself from it, and protect those for whom you are morally and legally responsible from it at a reasonable cost and in a timely manner... you may be held liable in a court of law when, in the future, these attacks occur and people are killed or even biologically affected (whether short-term or long-term);
- 2) Powerful entities (who created this problem) will most likely deny the existence of any such threat, or they will simply ridicule it. This has been their standard MO (Method of Operation) throughout history. YOU will have to decide whether or not to believe thousands of reports published by respected scientists, engineers and institutions who have, for decades now, been telling us otherwise. Your own parents and probably your teachers have taught you: It is *ALWAYS* better to be safe than sorry. Best advice!

Quite frankly, no one is happy with this new threat (well, maybe the terrorists who are still ignorant of our attempts to thwart their latest high-tech RF/EMF weapons - but, when they learn about our detectors, they won't be happy, either). NxDef is US-owned and US-based (Florida). All of our products are (and always will be) manufactured, assembled and tested in the US. Our support teams are all US-based.
